

Window controls and status

The **HIGH** level windows are automated to reduce the temperature and/ or the CO₂ to Oxygen ratio in the space.

These windows can be temporarily closed by pressing this button when the green ring is illuminated.

Where available use the **LOW** level windows to control comfort in this space. If however the amber light is on you will also be saving energy by keeping these windows closed as the central building system is already working to address comfort levels in the space.
