

Bike Safety

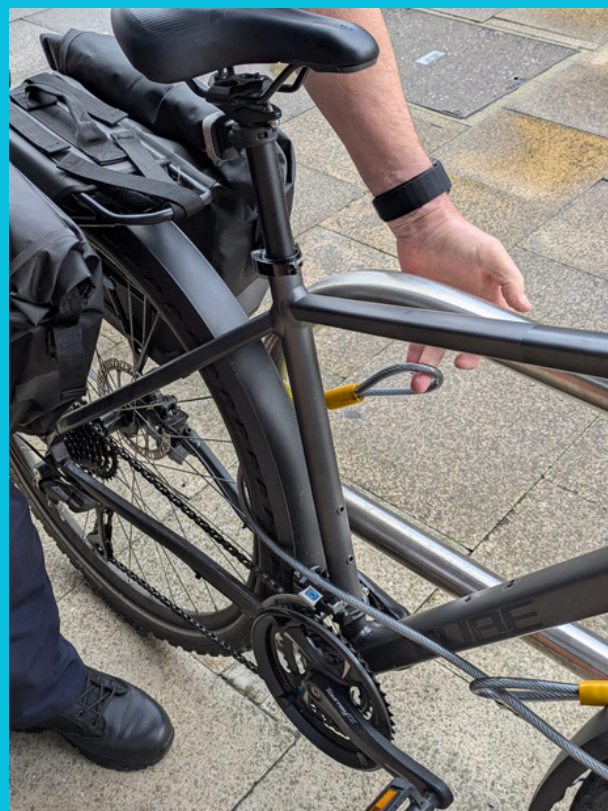

It is important that when securing your bike, you use good quality D Locks as cable locks will not provide adequate security for your bike. To see how a bike is secured, please see instructions below.

1. Feed cable through front tire.

2. Feed one end of the cable, through the whole on the other end, so the cable hugs the tire.

3. Loop the end of the cable through the back tire and around to the frame.

4. Place the D Lock around the frame, ensuring it also goes through the loop at the end of the cable. Ensure everything is secured to the frame.
